Plate-*Oh!*

A new philosophy for paper plates

Natural adhesive is used all around the outer edges of the plate to hold the layers together, except this one corner.

Structure:

- 10 Thin biodegradable sheets (can be waxed for extra water and tear resistance)

- Thicker biodegradable base to give strength when reaching last few layers.

- Natural adhesive applied to the outer edges of all the layers, acting as a belt holding everything together. One corner is left without adhesive to allow the user to peel off.

The Layers can be steam pressed together for extra hold and structure.

A plate that you literally use up until the last layer.
