

Entry Delivered to Consumers and Eco-Sustainability

3. How the entry is manufactured and delivered to its consumers

Heery consults with its clients to determine the sustainable measures and materials that suit the project. Minimizing a building footprint through better space planning, incorporating recycled or sustainable materials, using low VOC materials, sourcing local materials, recycling construction waste - these are some of the deliverables we provide our clients throughout the planning, design and construction process.

4. How the entry and its function/use maintains excellence in eco-sustainability in an environmentally friendly and responsible manner.

Heery maintains excellence in eco-sustainability internally as well as with its clients by focusing on methods and materials that maximize energy efficiency and minimize our carbon footprint. With more than 250 LEED Accredited Professionals on staff, ranging from architects and engineers to commissioning agents and interior designers, we can easily help our clients understand the benefits of sustainable design and construction as well lead them through the sustainable process until the project is completed.
